

Matronics Sublight Underwater - 12V RGB Lamp

An updated model of our RGB underwater lamps that now can be connected directly to 12V. 3 very bright High Power LEDs produce a phenomenal light.

Our beautiful and advanced RGB underwater lamp with 3 x 3W RGB LEDs from Edison Opto allows you to change the colors of the light with precision.

Buy online at:

With a color controller, you can change the three color channels: red, green and blue individually and by combining these three primary colors you can make countless color-combinations.

Improvements in version 2

- Higher quality profiles, that are now CNC machined instead of laser cut
- Deeper and more durable anodizing of the profiles
- Ends with a better design, that now removes the need for special washers when mounting.

The lights run directly on 12V DC making it easy to connect several lamps to the same color controller. The lamps are compatible with all kinds of 12V RGB color controllers, which allows you to create advanced solutions with zone functions and remote-controlled from a Smartphone device.

The lamps are constructed in the same way as single-color lamps - solid products designed for underwater use.

Connection:

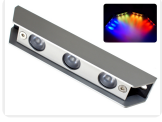

Black wire to Red on controller

Blue wire to Blue on controller

White wire to Green on controller

Brown wire to + on controller
