

2 pieces Canbus - Resistors - 16W/12V

A smart way to avoid error messages when you use LED Bulbs

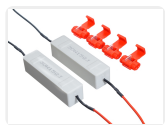

When switching the daytime running light bulb with diode bulbs, the power consumption will be lower than usual and there can be therefore experienced error messages on some newer cars with Can-Bus or bulb-control. You will therefore need to apply these "cheat resistors", which raise the consumption, so that it matches a regular bulb. The resistors will be connected to the + and - approach from the car.
